

Model Analysis of Effect Evaluation of Industrial Structure Adjustment Driven by Regional Economy

Rong Su

Tianjin University of Commerce, Tianjin, 300134, China

Abstract: With the continuous development of the times, the industrial structure starts to pay more attention to the coordination and sustainability of development from the previous emphasis on efficiency. It has changed from a fast development to a good development. This is the adjustment of industrial structure. In recent years, china attaches great importance to the effect of industrial structure adjustment. Therefore, the model analysis of the effects of industrial structure adjustment driven by regional economy mainly focuses on characteristics of regional economic development, the possibility of industrial structure adjustment and the way of industrial structure adjustment.

Keywords: Regional economy; Industrial structure; Evaluation

1. Introduction

Regional economy is the foundation and soul of a region's development. Regional economy is related to the present and future of the region. Regional economy needs to take necessary and better measures to promote its better development, in order to promote the better development of regional economy, the adjustment of regional industrial structure is very necessary. Due to the influence of environment and other factors, the industrial structure has undergone great changes, and the adjustment of industrial structure is imperative. In the process of industrial structure adjustment, we must pay attention to the effect of industrial structure, so we need to evaluate the effect of industrial structure adjustment. The author mainly makes a simple analysis around the characteristics of regional economic development, the possibility of industrial structure adjustment and the way of industrial structure adjustment.

2. Characteristics of Regional Economic Development

As a result of area different, the development of economy is not identical also. The development of regional economy should accord with the characteristic of area first. Local geographical environment is the life of local regional economic development and it plays a vital role . The Hami melon in Xinxiang province is famous at home and abroad, and the coconut fruit in Hainan is also the local characteristics. Only in line with the local regional environment, can it meet the requirements of sustainable development and produce green products that meet the requirements of development. Among many factors, the

feature of region plays an irreplaceable role. Region is an important factor that cannot be ignored when one region is different from other regions. Region directly affects the development of the present and future. The region bears the local customs as well as the memory of the times, and it is a continuous driving force for local development formed in the long-term development process of a region. Regional economic development that does not conform to regional characteristics can also improve economic efficiency in a short period of time, and however, it will cause the destruction of regional ecological environment over time. Therefore, the evaluation of the effect of industrial structure adjustment driven by regional economy should first consider the development of local regional economy. Seize the life and soul of regional economic development, so as to lay a solid and reliable foundation for the sustainable and fast development of regional economy.

Regional economic development should understand the influence and impetus of regional characteristics in the whole country. Regional economy is related to the present and future of a region and its role is self-evident. The region needs to survive, and the region should develop continuously. In order to promote the continuous development of the region, it is necessary to evaluate the influence of the regional development on the local and the whole country in the history, at present and later. With the development of science and technology, some regions are experiencing rapid economic development, which promotes the upgrading of products by infiltrating scientific and technological factors. At the same time, it also extends the industrial chain. One regional product may be extended to other industries, forming a virtuous

circle. The development model of this kind of regional economy is worth advocating and drawing lessons from. For example, some strategies like rebounding of north-east old industry base, rise of central China, China western development have been continuously improved in recent years. They have made important contributions to the development of local economy. If the region's economy occupies important position on a national scale, then the impetus and possibility for economic reform in the region will be greater. Shanghai is the leading city in China's economic development. In the process of the regional economic development of Shanghai, it has been continuously renewed and upgraded to promote the local and national economic development. Generally speaking, if the economic development of a region occupies more weight in the whole country, it can promote the economic development of the region. The region bears greater responsibility for national economic development. However, this is not fixed, but it changes with the continuous development of the local region and the constant change of the current situation.

Regional economic development should also strengthen the links between the various regions to form a new pattern of complementary advantages. There is no completely independent thing in the world, and there is no completely independent existence. This is also the case in the process of regional economic development. Each region cannot exist alone without any connection. Some goods are produced in complementary ways between different regions, while others are substitutes. These interchangeable products are an inseparable relationship. The existence of one party presupposes the existence of the other. Losing one, the other will not exist. For such products, it is more important to strengthen the connection between regions, which is self-evident to promote the power of regional economic development. Region is the embodiment of the characteristics of a region, and the premise of the formation of the region is independence. Only independent space can form unique regional characteristics. In ancient times, there were no strict and definite regions, and the world was a vast expanse. This shows that the regions were formerly a whole, and since they were indivisible, the possibility and reality of their interconnections were greatly increased.

3. The Possibility of Industrial Restructuring

Industrial structure adjustment is another important content of regional economic development, and this important content involves somewhat in the text above, and the detailed and specific analysis will be made here. In the process of industrial structure adjustment, it should be noted that not every industrial structure can and is suitable for adjustment. Some industries will play a greater role and effect after adjustment, while some industries

will cause greater damage and affect their normal development after adjustment. Therefore, in the process of industrial restructuring, it is very important to consider the possibility of industrial restructuring.

The possibility analysis of industrial structure adjustment should consider the contribution rate of the industry to economic development. The existence of some industries with high production efficiency and large profits is necessary. If there is no such industry, it will cause huge losses to the local and even the whole country. For such industries, we should protect them and pay attention to the upgrading of their products. We try to make the brand famous in the world, increasing the added value of products and improving the influence of products and core competitiveness. Only in this way can the regional economy develop better and make greater contribution to the development of the local region. Such industrial structure has the possibility and necessity of its adjustment, which is the way for an enterprise to survive and develop and also the fertile soil for regional economic development. However, on the contrary, some other industries are vulnerable due to their own nature, especially some industries with low cost, low profit and long production cycle. For example, the wholesale of small goods, the value created by it is relatively weak. In addition, due to the impact of other industries on its competition, or its own development process does not meet the requirements of sustainable development, it will inevitably cause certain obstacles to the local economic development. The space and possibility of industrial structure adjustment of such enterprises are small. In this case, there will be huge obstacles to industrial structure adjustment, especially for some enterprises with serious environmental pollution, and they should be banned in time. Only in this way, can they meet the requirements of scientific development in the new era.

The possibility analysis of industrial structure adjustment should take into account the different needs and requirements in different development stages. In the initial stage of its development, some enterprises may not have obvious effects or their value has not been really played. However, with the development of the times, the economic value of this industry will play a greater role after it accumulates to a certain extent. Especially some of the industries that have emerged in recent years. Maybe in the past, when the ideology was relatively conservative, people could hardly accept the product or the products could not meet the needs of the masses at the time. However, with the update of the new generation's concept in the new era, the value of such products will be greater and greater. For example, electronics in its early stages of development may have been difficult for the last century's generation to adapt to and accept. However, with the embodiment of its value, its advantages become increasingly obvious, and people in the new era have greatly

improved their acceptance of it. Nowadays, electronic technology penetrates into every corner of its development. Wherever and whenever you are, you can't do without your electronic equipments, without electronic devices, the country is practically paralyzed. The possibility of industrial structure adjustment still depends on the acceptance and approving degree of people. People have different degrees of acceptance of different things. Generally speaking, the acceptance of food and clothing industry is relatively obvious, while for other industries that are not closely related to life, it is relatively passive. Under this kind of circumstance, structural adjustment of regional economic industry should focus on its main respects, attract the eye of local people, and play a greater value as far as possible.

4. The Way of Industrial Structure Adjustment

There are many ways to adjust the industrial structure. The adjustment of industrial structure is the result of various factors. Due to the continuous development and changes of the times, the adjustment of industrial structure is imperative. The author thinks that the adjustment of industrial structure should basically hold the following respects.

Firstly, industrial restructuring adjustment should conform to the rules of sustainable development. In today's era, sustainable development strategy is deeply rooted in the hearts of the people. If we let the regional economy be in unbeaten position in the ranks of industrial structure adjustment, it is necessary to constantly adjust the industrial structure. Of course, in the process of industrial restructuring, we should draw the experience of experts and scholars, combine it with the local development reality, and produce an excellent industrial economy.

Secondly, industrial structural adjustment should absorb the essence of each district. In the process of adjustment of local industrial structure, dross will inevitably be encountered. For the dross that are difficult to develop, remove it consciously, so that there will be more space to hold those essence. Of course, the essence is limited, and the absorption of essence should focus on the best and absorb the essence of other regions widely. Due to its different natural environment and cultural atmosphere, each region has great differences in its excellence. So, learn to absorb the essence of different regions. This process of absorbing the essence can specify some local policies according to the needs of local development, invest some funds in talent training and technical training, and introduce some preferential policies to retain local excellent talents. Only in this way can we really promote the development of local economy and the adjustment of industrial structure.

Finally, attention should be paid to the adjustment of humanistic industrial structure. Economics and politics are important, but the influence of culture is too great to ignore. In order to occupy a dominant position in the national and even international competition, we must improve the cultural influence of the region. The development of humanities industry has many advantages. First of all, it has no visible ecological pollution and it will not cause environmental damage in the process of development. However, this does not mean that it has all the advantages, some vulgar culture also damage the development of regional industries, therefore, to the elegant culture, we must inherit and carry forward, and carry on the adjustment unceasingly.

5. Conclusions

The effect of industrial structure adjustment driven by regional economy is an important part of regional industrial structure adjustment. In the process of regional economic development, it is necessary to constantly adjust industrial structure and promote the optimization and upgrading of industrial structure. Industrial structure is the life and soul of industrial development and it plays a crucial role in the process of industrial development. The characteristics of industrial regional economic development, the possibility of industrial structure adjustment and the way of industrial structure adjustment are important elements in its development process. If we want to make it development better, overall planning should be made. On the basis of complementary advantages, absorb each other's essence. At the same time, the unreasonable elements should be discarded. Only on this basis, regional economy can better achieve the transformation and leapfrog development. Industrial restructuring can achieve the desired results. Only in this way can the regional economy become an important part of regional development and play a greater role in the new era. Regional economic development should be a long-term strategy.
