Abstract: As the number of graduates in recent years is much larger than the number of professional positions. In addition, the company's requirements for job seekers are more demanding, and most of the positions require candidates to have corresponding certificates, resulting in deviations in the values of college students' research, and the phenomenon of blind research is becoming more and more serious. Through the analysis of the status quo and the proposal, this paper effectively guides the students how to correctly view the competitive pressure of research.

Keywords: Study for college students; Correctly examine; Certificates

1. Introduction

With the rapid development of education in China, In the case of college enrollment expansion, the number of new graduates increased dramatically. In the human resources market, the number of graduates is much greater than the number of jobs. Because the company's demands on job seekers are so stringent, and most jobs require candidates to have the appropriate certificates. Now days college students believe that one more certificate means more opportunities, which make "certificate fever" continue to spread. It not only reflects the improvement of college students' sense of distress, but also reflects the increase of professional and technical personnel. The improvement of the quality of talents is the sign of the improvement of national intellectual resources and comprehensive strength. However, behind the phenomenon of "certificate fever", there are some worrying issues.

2. Analysis

Recently, the topic of certificate has been brought into focus .According to a recent questionnaire survey, 67 percents of undergraduates did textually research. There are the following reasons for the Certificate fever:

Testify to improve their knowledge in the competitive society.

Own interest, Professional requirements, Irrationally considering its value and competitiveness.

The promotion of training agency.

Fuzzy guidance for parents and teachers.

The propaganda misleading of the training institution.

Colleges and universities focus on the assessment of certificate skills by adding points.

Personally I think that we should rationally choose the certificates we need to take according to our future career plans. For example, if you are looking for a job after graduating from the college, The company will review whether you obtained the relevant certificate in college. Combine the capabilities required by the company, have you assessed whether you can get the position or not?

Obviously, the standards of corporate recruitment and the requirements of college students' own development, in fact, require college students to have a strong comprehensive ability. In turn, work has a guiding role in the textual criticism of college students. At present, there is a phenomenon of college students' "certificate fever". Although many universities can correctly understand the importance of professional courses, this kind of understanding fuzzy, and it is easy for them to follow the trend blindly. Therefore, it is important to rationally guide college students to treat the phenomenon of "certificate fever".

3. Solutions

Although college students use their spare time to take certificates is the performance of hard working, but the time for students to review the examination is very limited, and there is also the phenomenon of blindly following the trend because of the lack of career planning.

As the phenomenon of blind research for college students is becoming more and more dangerous, the following suggestions are made:

First of all, we should rationally look at the propaganda and encouragement of schools and counselling institutions, carefully analyze ourselves, and according to their actual needs, obtain certificates that are of in-

terest, practicability, high gold content, and beneficial to their professional development. At the same time, set the correct goals and directions from the actual situation, and combine the economic strength, learning situation, career orientation, and professional development needs to carefully and appropriately obtain the corresponding certificates.

Secondly, learn to ease their psychological pressure, correctly face the influence of social employment competition, rational thinking, and actively participate in professional learning.

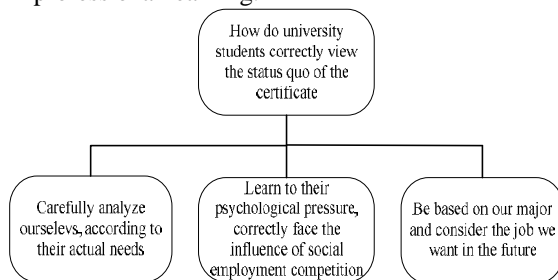

Figure 1. How do university students correctly view the status quo of the certificate

Finally, and most importantly, People should rationally analyze certificate never. We are supposed to be based on our major and consider the job we want in the future, and then take the relevant exams so as not to waste unnecessary energy and time.

Besides, all colleges and universities should improve the overall knowledge quality as the benchmark, market-oriented and deepen the teaching, correctly guide the blind research and mentality of college students, and participate in the target-related activities in a planned and analytical manner to enrich their experience. Rational choice of relevant professional qualification examinations.

4. Conclusion

In terms of textual criticism, it does prove a person's ability, but it is not the only proof of one.

This paper discusses how to correctly examine the phenomenon of college students' research, which can effectively alleviate the sensation of blind study for college students. It will play an essential role in the future enrichment of students' learning life and the competent guidance of education.
