Abstract: personality development refers to the formation and development of personality of human beings after birth to adolescence. And one's personality is not born with, but based on the individual's physical qualities, in certain social and historical conditions, formed and developed gradually through practice. Paying attention to students' personality development has become an important topic and hot topic of education research in many countries in the world.

Keywords: Modern Education Technology; Classroom Teaching; Individual Development

1. Introduction

In 1980s, some developed countries began to regard human development and personality development as the theme of educational reform [1-4]. The development of our society and the deepening of education reform, the educational circles pay more attention to this topic and this is people progress to nature of education and the education function of the knowledge and understanding [5-7]. Over the years our personalized education theorists and teachers get attention, carried out a lot of useful exploration, has made many achievements, promoted many education reform trend, such as good education, education, education, the overall situation of subject education and innovation education. Although the name is different, but the essence and purpose are the same, that is, people-oriented, pay attention to life [8-12].

The classroom teaching under the condition of modern educational technology to promote the all-round development of students as the main task, rather than simply impart knowledge is the main teaching activities are students, not teachers the goal of education is to promote the development of students' personality, cultivate personality, talents with innovation ability not sticking to formalities, and the spirit of innovation, rather than the same, tend to unify social groups.

2. Classroom Teaching of Modern Educational Technology

In modern education, the development and application of educational technology has set up a good platform for students. Modern educational technology is the use of modern educational theory and modern information technology, through the process of teaching and learning and teaching and learning resources design, development,

utilization, management and evaluation, the theory and practice to realize the optimization of teaching. In this learning process, teachers can use advanced teaching ideas, combined with some multimedia tools, timely transfer of teaching information to students. Students can use some advanced learning method for selective use of multimedia tools to learn knowledge and get more information through the network, make the student's personality is reflected.

3. Students' Personality Development

From the point of view of teaching design, promoting personality development should be combined with modern educational technology. The teaching design is based on the communication theory and learning theory, theories and ideas to use system theory to solve the problems and requirements of teaching, and teaching goal setting. In order to determine the overall training objectives of each course, it is necessary to put forward specific requirements for the teaching design of each course. With the music curriculum as an example, music as an independent course and modern educational technology, its independent character is changed a lot, and the integration of modern educational technology. Then the music class teaching design and the traditional design should be different, in the target control, factor analysis, decision making and priority of teaching content teaching and other aspects should be more targeted. A lot of teaching content in music teaching in the different singing style, tone, practice methods and stage performance, separately, are professional content features, but from the audiovisual point of view, both the individual and common characters. How to use modern educational technology to make students feel their characteristics, to improve the overall music learning and in-depth understanding and

grasp, improve the processing ability of visual education etc.. For other courses, as long as it is combined with modern educational technology is the same reason, we should fully pay attention to and improve its efficiency in the process of teaching in teaching design.

4. Individualized Education in Class

Specifically, the implementation of personalized education in the classroom, in the classroom teaching process, teachers' teaching activities and students, cultivating the ability of students, mobilize the students to actively participate in and stimulate the development of students' potential and promote the comprehensive development, the classroom teaching should also have strong pertinence and flexibility. Classroom teaching is the teaching content and a series of personality characteristics in world view and value orientation as the core together, through the psychological process of certain students internalized internal things. At present all kinds of classroom teaching methods research is very active, for emphasis, teaching content in the difficulties and key points, teachers can according to the characteristics of the actual classroom teaching and students, combining modern education technology of flexible and effective to solve the problem, the teaching content and moral internalization, including knowledge, intelligence and modern ideas of internalization the organic combination of technology education, and make it easier to achieve "essence, easy to understand, useful" the purpose of teaching, and promote students' personality development in the process of psychology in. In addition, it should be noted that the classroom teaching perception, attention, association, imagination, emotion and understanding the aesthetic and technical conditions under modern education combined. Through various means of educational technology to stimulate students' aesthetic psychology, which is the effective method to develop the students' personality and mobilize the enthusiasm of students, is the key to improve the quality of education and teaching.

The characteristics of diversification, the teaching methods of the integrated, interactive, real-time processing technology in modern education is reflected in the most typical, these basic features have very positive significance in quality education and personality education in today's. Education is the development of the human personality, in a sense, the teaching of modern educational technology in education is to enable students to better develop and improve their own personality, but to make the best effect in promoting students' individuality education, we must make the student individuality development rules or combine elements.

5. Conclusion

With the development of information technology, network learning came into being, is the emergence of a new way of learning, personalized learning has obvious characteristics. From our practice, network learning has obtained certain achievements, and even some online school, but did not have a profound impact on the current basic education. The reason is that there is no definite value orientation in the field of practice in network learning. Every kind of teaching and learning it.
