

Innovation and Sublimation: From Scientific Development View to Five Development Concepts

Feifei LI

Institute of Marxism, Southwest University of Political Science, Chongqing, 401120, China

Abstract: In order to ensure the smooth realization of "two hundred years", China's economic development concept has developed from the scientific development concept to the five development concepts. Two different periods of economic development ideas are under the guidance of Marxist scientific theory, according to China's social practice and derived from the experience of the theory of sublimation. In the face of the "13th Five-Year Plan" period in China, all aspects of the new situation, new problems, five development ideas put forward some new coping policies. The five development ideas have great significance of the times, and its presentation embodies the combination of science and times, value and reality, purpose and practice, and provides theoretical guidance for the solution of new problems. At the same time to ensure the full implementation of the five major development concepts, China must have the appropriate policy improvement.

Keywords: Innovation; Sublimation; Scientific development concept; Five development ideas

1. Introduction

The "five development concept", symbolizes: innovation, coordination, green technologies, openness, and sharing. It aims to realize the "scientific concept of development" which in itself is a concept of inheritance and sublimation, which indicates that China is gradually deepening its understanding of the development of law in terms of its effect on the social economy. It was implemented in an attempt to solve the problems we encounter within our current situation in an attempt to increased confidence. As well as to provide an ideological weapon for the realization of building a moderately prosperous society. Xu Shaoshi (2015) has stressed, that the "Proposal" has important and far-reaching historical significance to ensure the timely completion of a comprehensive well-off society, and realizing the great rejuvenation of the Chinese dream.¹

2. The Summarization of the Chinese Marxist Theory Era

2.1. Scientific Theory as the Basis

Since the establishment of the Communist Party of China, especially after the Zunyi Meeting, strict adherence to the basic principles of Marxism, in addition with China's specific practices, and ultimately the new democracy (the victory of the revolution), that the People's Republic of China established upon its great victory. But how to continuously develop our parties' appearance after the founding of the Chinese economy, is a topic infused with

confusion and uncertainty. This confusion and uncertainty fueled the launch of a series of exploratory research and questioning about the concept of economic development in changing times. For the problems of which China faces in the new era, Jintao in 2003, Comrade put forward an important theory entitled "scientific development", that was focused on a people-oriented, comprehensive, coordinated and sustainable development concept. "Scientific concept of development" which was put forward indicates that China has begun to focus on social issues, rather than the one-sided pursuit of economic development. Under the guidance of the theory of scientific concept of development, effectively easing the imbalance in the development of urban and rural areas, widening income gap and other new social problems, and promoting social harmony.

In the "Thirteenth Five-Year" period, China still adheres to the basic principles of Marxism, with the addition of course of the specific situation which present themselves within China. Xi Jinping, general secretary at the core of the collective leadership of the CPC Central Committee, under the guidance of said committee, adheres to the "scientific concept of development", according what can be seen in response to a series of new problems in our country, "Thirteenth Five-Year" during the occurrence of the five-proposed development concept. These five development concepts provide a solution for a range of pressing current social problems which may arise, but also provides a powerful ideological weapon for the completion of the final phase of a comprehensive well-off society.

2.2. Background to the Chinese Practice

Two things which are needed in adhering to the concept of economic development is on the move and Philosophy particularity of contradiction, which are based on the realities they face and background presented with the corresponding concepts.

Our country, in the "15", "Eleventh Five-Year" period made outstanding achievements, greatly enhancing our comprehensive national strength, and the people's living standards all improved significantly, a substantial progress in ecological construction, the system also greatly increased our international presence. But there are still many problems which should not be ignored in the process of economic and social development, such as ignoring the quality and efficiency of unity in the process of economic development, regional and rural development still exhibits imbalances and other issues. To this end, Comrade Hu Jintao put forward the "scientific concept of development" which stands as an important concept in an attempt to better these imbalances.

China is seeing a new economic normality within the "Thirteenth Five-Year" period, a new situation in the new political ecology, a new state of culture. Firstly, since 2010 after China's economic growth saw a continued decline in its growth, and due to this presented a worrisome trend of economic growth, However, the declining growth rate is also accompanied by some rather positive trends. Secondly, the politics "along the way" of regional cooperation platform, proposed a "five in one" new pattern, faced with the challenge of achieving "four comprehensive". There is a pluralistic, diverse and varied culture which may collide and cause mutual confrontation on the situation of the culture. Faced with the new background on economic, political, cultural, "five development concept" has put forward the necessity of change.

2.3. The Status Quo as the Object of Society

The two economic development concepts adhere to the principle of the whole and part of the dialectical relationship, that is, while recognizing the overall role, emphasizing the key part of the overall play a decisive role in the philosophical principle. Therefore, both of them focused on the issue of social development in China.

According to China's "15", "Eleventh Five-Year" period of development, China's outstanding achievements are worthy of celebration, however, at the same time also put the focus on the existence of the problem. China's economic and social development, due to too much emphasis on economic growth and neglect of the overall development, over-emphasis on coastal and urban development led to regional, urban and rural development imbalances. Excessive attention to the development and utilization of natural resources and ignorance of the harmonious development of man and nature. "The scientific

concept of development" is aimed at the development of our shortcomings on the existence of these.

In order to ensure that the economic development during the transition still maintained a good momentum of development, China's focus on the economic, political, cultural emergence of the new norm, new ecology, and new patterns above. Our economy, while still impressive, is in a slowdown period and faced with the problem of structural optimization; political officials do not face and improve the serious strict rule of the party, according to the rule of law requirements; cultural existence of a variety of cultural mutual agitation, collision problems, the international presence of how to open up the issue of strengthening autonomy. In view of the outstanding problems in the development of the "three five" period to Xi Jinping general secretary as the representative of the CPC Central Committee put forward the "five development concept."

2.4. Taking Scientific Measures as A Measure of Caution

The two economic development concepts adhere to the important role of scientific methodology, in recognition of the current social problems we are facing, in order to change the reality for the better, is to focus on finding a scientific way to solve the problem.

The one-sided nature of the pursuit of economic growth and the emergence of the problem is not conducive to people's lives, the scientific concept of development emphasizes a people-oriented approach; excessive emphasis on economic development and to not take into account other aspects of development will cause issues, scientific development concept also emphasizes comprehensiveness; the understand the current face of the urban and rural dynamic structure, Regional development imbalances, the scientific concept of development emphasizes coordination of man-to-man and man-to-environment; extensive economic development led to waste of resources, environmental damage, in response the scientific concept of development emphasizes sustainable development. It is a scientific methodology, in particular, is a scientific and dialectical approach.²

In order to achieve the structural adjustment, the purpose of power conversion, the five development concepts require innovation and development, so that innovation runs through the theory, system, science and technology, culture and other aspects; in order to achieve regional, urban and rural, industrial structure balanced development, it requires coordinated development, To achieve a comprehensive well-off life; in order to achieve green water in the mountains, blue sky and white clouds to enjoy the key in the desire to live a good life, rests in green development. The development of a green low-carbon economy is vital to achieve a society where people and nature come together in harmony; in order to achieve a

higher standard of living. To promote the autonomy of China in the open world, it requires open development in order to form a deep integration of mutual trust and mutual benefit for its people. In order to achieve the natural and social resources for the whole of our people equally, it requires the sharing of development, a true opportunity of fairness, to protect people's livelihood, and ultimately to achieve common prosperity, comprehensively well-off.

3. Theoretical Sublimation: The Five-Development Concept Stands as the Scientific Development Concept Advancing with the Times

Social development to follow the negative law of negation, so that society through its own dialectical negation of the final development. China has proposed for an update on "13th Five-Year Plan" period. It embodies the scientific, the times, the value, the reality, the purpose and the practicality, and is an important guarantee for the comprehensive construction of the well-off society. Inheritance and development.

3.1. The Combination of Scientific Approach and the Modern Time

Allowing the "Five development concept" to keep up with the pace of time, fully realize the "four comprehensive" strategic layout of the close integration of science and the characteristics of the combination of the time.

Five development "through the five aspects of the implementation of a comprehensive deepening reform" so that the "five in one" can enhance the sense of independent innovation, coordinated development awareness, green low-carbon awareness, open development awareness, resource sharing awareness; it implements a comprehensive rule of law. To coordinate the legislative, administrative and judicial relations between the three, to improve the scientific legislation, strict law enforcement, impartial justice, national awareness of the law-abiding; it implements a comprehensive strict rule of the party, to achieve thinking, organization, style and system construction. To coordinate the relationship between the government and the public, to improve the credibility of the government, and gradually aid in the universal access to social resources, to ensure equal opportunities, such as "precision poverty alleviation.". The "Five development concept" when put forward and put in practice, can build a well-off society, In the drive for socialist modernization and the great realization of the great revival of the Chinese dream.

"Five development concept" to promote the "area along the way" strategic layout of the development. Through the guidance of innovative ideas, to play the "one side along the way" advantage, strengthen bilateral east and west trade. By better promoting inland economic devel-

opment so that the development of China's economic growth can better support the develop of new foreign markets. Narrow the regional development gap while also developing through the concept of "green" guidance. To carry out a wider range of green low-carbon economy development; through open concept guidance. So that better engagement with the world around us can lead to the better transmission of "theoretical guidance". This guidance in combination with open concept, and green development will allow us more room for development both nationally and internationally speaking.

3.2. The Combination of Value and Reality

The value of the "five great development ideas" is that it is a scientific concept that focuses on the problems facing our country at present, furthermore that it focuses on solving practical problems. So, its importance lies in the realization of the combination of value and reality.

First, the optimization and upgrading of our industrial structure requires proper innovation and development. China is rapidly becoming a world power with its rich labor resources, but with the ever-deepening development of China's economy, we have come to realize that it is not enough to rely solely on low labor cost advantage. Only by strengthening the core competitiveness of industrial technology, investing in new industries. In order to achieve the economy, we wish to obtain, it must come from extensive to intensive change. To promote sustainable economic development in order to become a productive super power from a productive power, and enhance international competitiveness. This production power results in a large number of Western companies relocating to China to build factories, on the one hand the use of China's labor resources, on the other hand also led to serious damage to China's ecological and environmental problems. In order to solve the problem of ecological hegemonies in China, China has put forward the concept of innovation, green technologies, and so on, so that people will gradually establish environmental awareness and enhance scientific and technological innovation ability to reduce the serious pollution of enterprises in China. Second, the imbalance of economic and social development requires a coordinated development effort. Our priority development of the eastern coastal areas to promote the international "opening up" of coastal cities, led to the non-priority development of inland and western regions. This unequal attitude towards the western inland areas led to a slow process of economic development. When one looks at the economic development status it would appear that the gap between east and western china is gradually widening. The level of economic development between urban and rural areas, while similar in its priority mindset as we see in east-west relations, is also due to historical, cultural, transportation, opportunities, policy and other reasons not to form a small gap.

Therefore, China must adhere to expand development in coordination, enhance the development potential in the consolidation of weak areas, so that each level of development of the national road in building a moderately prosperous not "left behind."³

Third, the ecological environment requires green development. In the past, China's extensive production methods relied too heavily on the consumption of material resources to stimulate economic growth. Some resources caused either unnecessary, or unwanted waste. These past forms of waste have caused environmental problems in the present day. In addition, China's industrial wastewater, automobile exhaust emissions and reduced forest cover and other issues, have all resulted in growth of the greenhouse effect, haze weather and other phenomena that show the worsening quality of the environment. These environmental pollution hazards have a negative impact on our national health. In order to ensure that we and future generations can live under blue skies and white clouds, we need to implement green, sustainable development concepts to establish a scientific development pattern, in order to achieve the ultimate realization of harmony between man and nature.⁴

Fourth, the depth of integration around the world requires open development. Economic globalization is an inevitable trend, so our country has long been in line with the trend in the world economy. And in the open world economy, it truly is open waters. Now we have the opportunity to achieve a higher level, to expand our global layout by having wider areas of openness and improve the global governance of the institutional right to discourse. Due to overcapacity production, such as overcapacity of steel led to the development of some small-scale production of crude steel in China is facing difficulties and even the risk of bankruptcy, so our country must continue to explore the international and domestic markets, to find more sales to ease China's economic development and resist the falling market pressure.

Fifth, to play the dominant player in the world stage, the people are required to share the fruits of development. There are many imbalances in urban and rural development in different regions of our country, which shows that people in different regions enjoy different results in the process of development and progress in our country. Urban residents and rural residents now enjoy a higher standard of life, education, medical and other resources are not on a horizontal line, but a rising one. But in recent years, China's rural people's living standards and welfare levels have also been greatly improved, such as pension and medical insurance. Our government has been trying to narrow the gap, more and more rural renovation projects have been put into use, or are under construction. Therefore, adherence to the shared development can make all comrades enjoy a happier life, enhance the feel-

ing of national pride, enhance people's unity, towards the common prosperity of steady progress.⁵

3.3. The Combination of Purpose and Practice

The five development ideas are very clear and closely focused on the goal of building a well-off society in an all-round way to ensure the ultimate goal of socialist modernization. Therefore, the five development concepts have the characteristics of combining purpose and practice.

In order to ensure the realization of this stage, China needs to solve all the urgent problems facing its society currently, which requires China to implement the five development concepts to the real world, outside the realm of theory. Therefore, we can, through the relevant system safeguards, ensure the implementation of the five development concepts, to achieve with the "four comprehensive" strategic layout to endorse the coordination of social and other aspects of harmonious development. To achieve the purpose of combining with what is practical of the current society to provide a series of tangible results to current problems in order to achieve the ultimate goal of socialist modernization to do the pilot.

4. The System Supply: to Protect the Five Major Development Concept with Effective Implementation

"Five development concept" is General Secretary Xi Jinping on October 29, 2015 at the Fifth Plenary Session of the Eighth Central Committee for the development of China. At this present time, we are facing new problems and need to put forward our latest ideas. It is scientific, in line with the requirements of the times. As long as we hold a profound understanding of its connotation, throughout the whole process of economic and social development can we continue to grow. To lead the practice of innovation and innovation incentives to promote reform and development, will we then be able to write a new chapter in the history a progressive, forward-thinking China. In order to ensure the ultimate comprehensive end goal of building a well-off society, the five-major development concept of the effective implementation of the need for system protection.⁶

4.1. Build an Innovative Incentive System

In order to achieve successful transformation of the economic structure of our country we need to always put innovation at the core of the overall development of the country. To encourage national innovation, so that innovation can become common practice throughout the entirety of society. Zhang Gaoli (2015) pointed out that since the 18th National Congress of the Communist Party of China, it is still necessary to unswervingly uphold and develop socialism with Chinese characteristics. ⁷To be

courageous in practice, to innovate and deepen the understanding of the law in regard to the ruling party, the law of socialist construction, and the law of human society development, Forming together a series of new ideas and new strategies. To this end, we need to improve the incentive system, through the material and spiritual level to stimulate the development of the industry to focus on innovation.

New ideas aid in achieving industrial structure optimization in the development of new industries and agriculture. All while strengthening the implementation of network strategies. At the same time, through a proper innovation promotion system we can encourage people to move in the direction of professional research innovation. One can contribute to the progress of national science and technology culture, and secondly can create a lot of employment opportunities. With innovation pushing research we also influence fellow individuals and enterprises to take part through a feeling of national unity. With a system which produces such positive influences we are able to create a good atmosphere of innovation consciousness. At the same time, in order to stimulate the vitality of individuals and businesses, the government is also actively giving policy and other aspects of support.

4.2. Improve the Public Service System

Socialism is a "harmonious society", in which all the people can do their best and get along well.⁸ In order to solve the problem of imbalance in development, China needs to adhere to coordinated equal development. Adherence to the coordinated equal development of urban and rural areas, economic and social development, and adhere to the "four modern" simultaneous developments. By observing both national hard and soft power of common mutual development, and continuously enhance the development of integrity. In order to ensure the realization of this goal, we need to continue to improve the public service system. Areas such as remote rural towns need to have sound public infrastructure, rural urbanization and security facilities. To promote the construction of new socialist countryside, one must focus on the development of the township economy at its roots. At the same time, the government is also actively advocating the various social organizations, enterprises and individuals consciously bear the corresponding social responsibility. Consciously practice the "industry nurturing agriculture", "urban support rural" development policy, within their capacity to contribute to the construction of public facilities will spread power to these weaker rural areas.

4.3. Optimizing Environmental Protection System

Realizing the harmony and unity of man and nature is integral to providing a solid foundation for China's economic development. China's economic development

process should be adhering to the green low-carbon cycle development concept, "both to meet the development needs of contemporary people, but also can not affect the development needs of future generations.". In order to promote the construction of beautiful China, we need to deepen the environmental protection system, so that the legal protection of the environment and no longer be limited by certain individual's personal gains. We all live under the same sky, and the protection of the environment is everyone's responsibility. All members of society should be involved in the act environmental protection, including that of large enterprise. Industry needs to consciously reduce the waste water emissions, to influence individuals in the conscious compliance of protecting the environmental beauty of China. So that the family, friends are involved in the protection of the environment, to create full months, not days, of blue skies and white clouds.

4.4. Adjust the Exchange Rate Security System

In the modern era, China faces the problem of excess production capacity. In order to solve this problem and alleviate the pressure of domestic development, we need to constantly open up to the international market. In order to enable enterprises to better able entire the international financial market. To do this, we need to adjust the exchange rate system. For example, during the "13th Five-Year Plan" period, General Secretary Xi Jinping opened this quest by visiting Europe. During his time in Europe he had successfully made the Renminbi formally recognized within the SDR on October 1, 2016. RMB now resides within the international mainstream currency basket. However, being on the international stage submits the RMB to the current falling economic pressure which is an important driving force. It will, to some extent reduce the foreign trade economic exchange rate risk, so as to stimulate enterprises to constantly open up the international market to ease domestic pressure. In addition, the RMB as a world currency can also promote the introduction of foreign advanced technology, and promote domestic economic development. As well as promote foreign trade and ultimately achieve a higher level, more robust and financially sound system.

4.5. Improve the Public Participation System

In order to protect the status of the people and to solve the social contradictions caused by the unequal distribution of social resources and social resources, China should continue to adhere to the shared development, pay attention to disbursement of fair opportunities, protect people's livelihood and enhance people's unity in order to ensure common prosperity So that all the people into a comprehensive well-off society. In order to achieve this goal, we need to improve the public participation system, in accordance with the "everyone involved, everyone

enjoys" requirements. And to supply the natural and social resources to allow the equality of opportunity to solve the livelihood problems and maintain social harmony.

5. Conclusion

The concept of economic development plays a guiding role in the construction of a country's economy and society. It guides the development of all aspects of society and is a barometer of the development of a country's society. The transformation of our country's economic development concept reflects the steady progress of China's economic development, but also shows that a profound analysis of the law of economic development. The law of economic development is also deepening, so our country according to the economic and social development process problems cause us to continue to develop better policy measures. The superiority of "Five Concepts of Development" is to realize the unity of science and the times, value and reality, purpose and practice. It is an important in order to guarantee the realization of the new blueprint of achieving a better, well - off society in 2020.
